

BLACK PIGMENT POWDER HAVING A LOW VALUE  
OF MAGNETIZATION, PROCESS FOR PRODUCING  
THE SAME, AND APPLICATIONS THEREOF

ABSTRACT OF THE DISCLOSURE

5           A black pigment powder having a low value of  
magnetization according to the present invention is  
characterized in that it consists of a composite oxide  
containing  $\text{Fe}_2\text{TiO}_4$  as a main component, wherein the total  
amount of Fe (II) and Fe (III) to Ti is from 150 to 300  
10 atomic %, in such an amount that the amount of Fe (II) to  
the total amount of Fe (II) and Fe (III) is 0.50 or more,  
and that the L value of a coating according to the Hoover-  
type muller method is 9.0 or less. It is employed to  
produce a toner composition, a coating composition, a resin  
15 composition, a cosmetic material and the like.
